Pieslēdzam moduli un dabujam HTML saturu

```
1 from bs4 import BeautifulSoup
2 from urllib.request import *
```

Izmantojot modeli BeautifulSoup mēs apstradājam HTML. Dabujam to url un lasam visu ko satur vietne

```
1 def get_html(url):
2     req = Request(url)
3     html = urlopen(req).read()
4     return html
```

Dabujam bildes

Vispirms izveidojām funkciju kura palīdz mums ieiet vietnē. Parsejam HTML lai dabūt bildes adresi. Pēc tam parējam uz "src" pēc ID nosaukuma un lejupielādēt bildes

```
1 def main():
2     opener = build_opener()
3     opener.addheaders = [('User-Agent', 'Mozilla/5.0')]
4     install_opener(opener)
5     for i in range(1):
6         html = get_html(url + str(i))
7         soup = BeautifulSoup(html, 'html.parser')
8         saraksts = soup.find_all(class_='preview')
9         for a in saraksts:
10            secondary_html = get_html(a['href'])
11            secondary_soup = BeautifulSoup(secondary_html, 'html.parser')
12            bilde = secondary_soup.find(id='wallpaper')['src']
13            urlretrieve(bilde, "bilde.jpg")
14            print('Download')
```
